

## Multi Frequency 2.0.0 - supplement to the chapters „Program selection” and „Frequency”

On beaches and wetlands, we strongly recommend that you only work in the Beach, Swamp, Basic or User1 programs. In these programs, the Multi Frequency operation ensures that the detector does not react (or reacts many times less) to water, coke, shale and other electrically conductive non-metallic objects. In other programs, Multi Frequency is optimized so that it has minimal masking with iron and high sensitivity to small objects.

The Multi Frequency operation icon on the main screen in Beach, Swamp, Basic and User1 programs is blue, in other programs it is black.

In the Beach, Swamp, Basic and User1 programs, the Hot Rock should be set to 0 when using Multi Frequency. The user can make minor adjustments to this setting to change the detector's response to salt water.
