

Dear user!

From 10 April 2017 we have introduced a new and improved software version for the Alter71 metal detector.

Below is a list of the modifications contained in Version 1.1:

1. New option to activate or deactivate VCO setting by the operator. This option can be found on the menu page under the AUDIO heading with the text: VCO Yes/No
2. The pinpoint operation has been changed, previously two indicators were used, one for small objects and another for large objects. There will now only be one, with a scale for the depth of the object. The indicator for depth is not dependent on the detector sensitivity, although the sound signal is.
3. Improved notch adjustment has been added. This can be activated either by simultaneously pressing  and  alternatively the buttons  and  may be used together.
4. The detector's operation during darkness has been simplified. If the backlight setting is 0, then when entering the menu the backlight will automatically switch on. The backlight will switch off by leaving the menu screen.
5. Th Level and Th Tone adjustments can be made in the Menu at the same time as listening to the effects of these changes.
6. The hot rock adjustment is now quicker.
7. There is now a menu subpage indicator, which will help make navigating quicker and more intuitive.
